

INTERNATIONAL X-Y POWER SUPPLY WIRING DIAGRAM (035887-01 A)

U.S. X-Y POWER SUPPLY WIRING DIAGRAM (036352-01 A)

Drawing Package Supplement

to

ASTEROIDS DELUXE™

CABARET

Operation, Maintenance and Service Manual

Contents of this Drawing Package

- Game Wiring Diagram, Coin Door and Power Supply
- Microprocessor
- Video Generator
- Switch Inputs, Coin Counter, LED and Audio Outputs
- Sheet 1, Side A
- Sheet 1, Side B
- Sheet 2, Side A
- Sheet 2, Side B

NOTICE TO ALL PERSONS RECEIVING THIS DRAWING
This drawing is the property of Atari, Inc. or its
subsidiaries and is protected by copyright law.
This drawing is only conditionally issued, and neither
may it be reproduced in whole or in part, nor may
any right in, or license to use, the subject matter of the
drawing be granted, without the express written
consent of Atari, Inc. or its subsidiaries. Any
attempt to reproduce this drawing or any part
thereof, or to manufacture for corporate written
license, no right to reproduce this drawing is granted or
implied. The drawing is issued under the terms of an
agreement with written permission from the corporation.

REGULATOR/AUDIO I PCB SCHEMATIC (034485-03 A)

Regulator/Audio I PCB

The Regulator/Audio I PCB has the dual functions of regulating the +5 VDC logic power to the game PCB and amplifying the audio from the game PCB.

Regulator Circuit

The regulator consists of voltage regulator Q1, current source power transistor Q3 and Q3's bias transistor Q2. The regulator accurately regulates the logic power input to the game PCB by monitoring the voltage through high-impedance inputs +SENSE and GND-SENSE. The inputs are directly from the +5 VDC and ground inputs to the game PCB. Therefore, the regulator regulates the voltage to the game PCB. This eliminates a reduced voltage due to IR buildup on the wire harness between the regulator and the game PCB. Variable resistor R8 is adjusted for the +5 VDC on the game PCB. Once adjusted, the voltage at the input of the game PCB will remain constant at this voltage.

Regulator Adjustment

1. Connect a voltmeter between +5 V and GND test points of the game PCB.

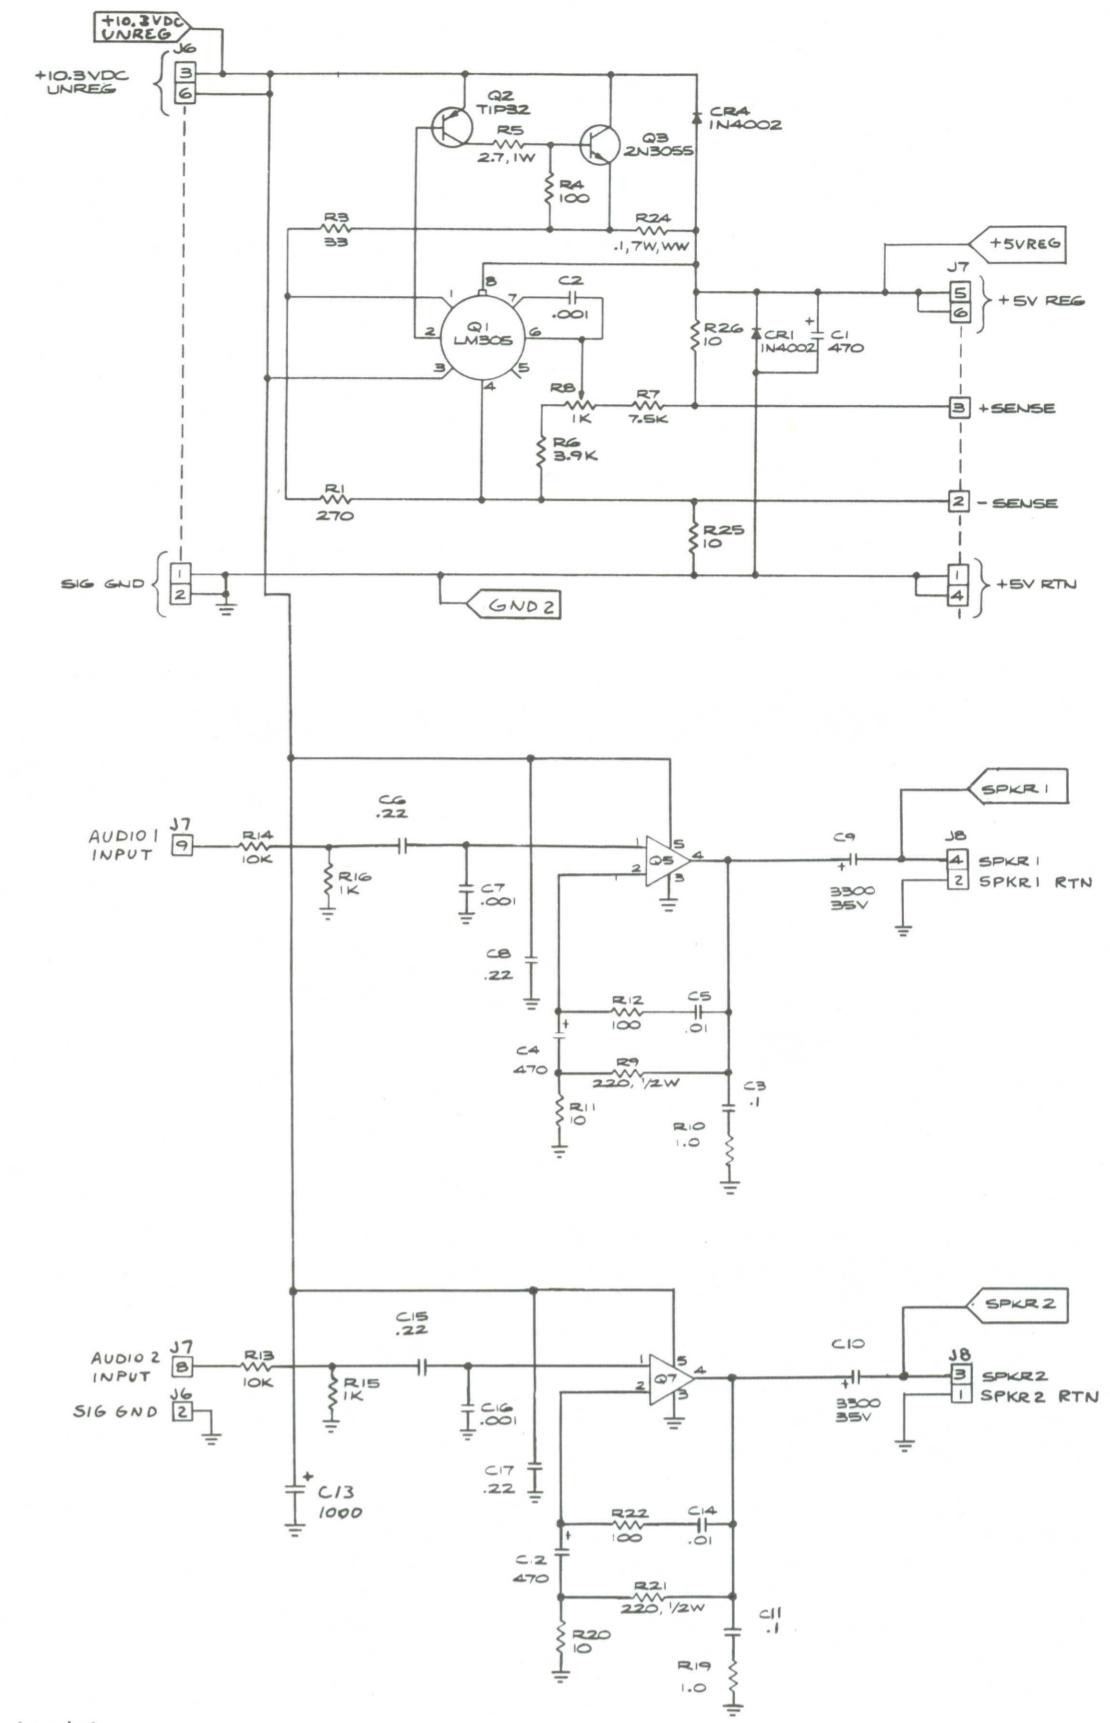

2. Adjust variable resistor R8 on the Regulator/Audio I PCB for +5 VDC reading on the voltmeter.

3. Connect a voltmeter between +5 V REG and GND on the Regulator/Audio I PCB. Voltage reading must not be greater than +5.5 VDC. If greater, try cleaning edge connectors on both the game PCB and the Regulator/Audio I PCB.

4. If cleaning PCB edge connectors doesn't decrease voltage difference, connect minus lead of voltmeter to GND test point of Regulator/Audio I PCB and plus lead to GND test point of game PCB. Note the voltage. Now connect minus lead of voltmeter to +5 REG test point on Regulator/Audio I PCB and plus lead to +5 V test point on game PCB. From this you can see which harness circuit is dropping the voltage. Troubleshoot the appropriate harness wire or harness connector.

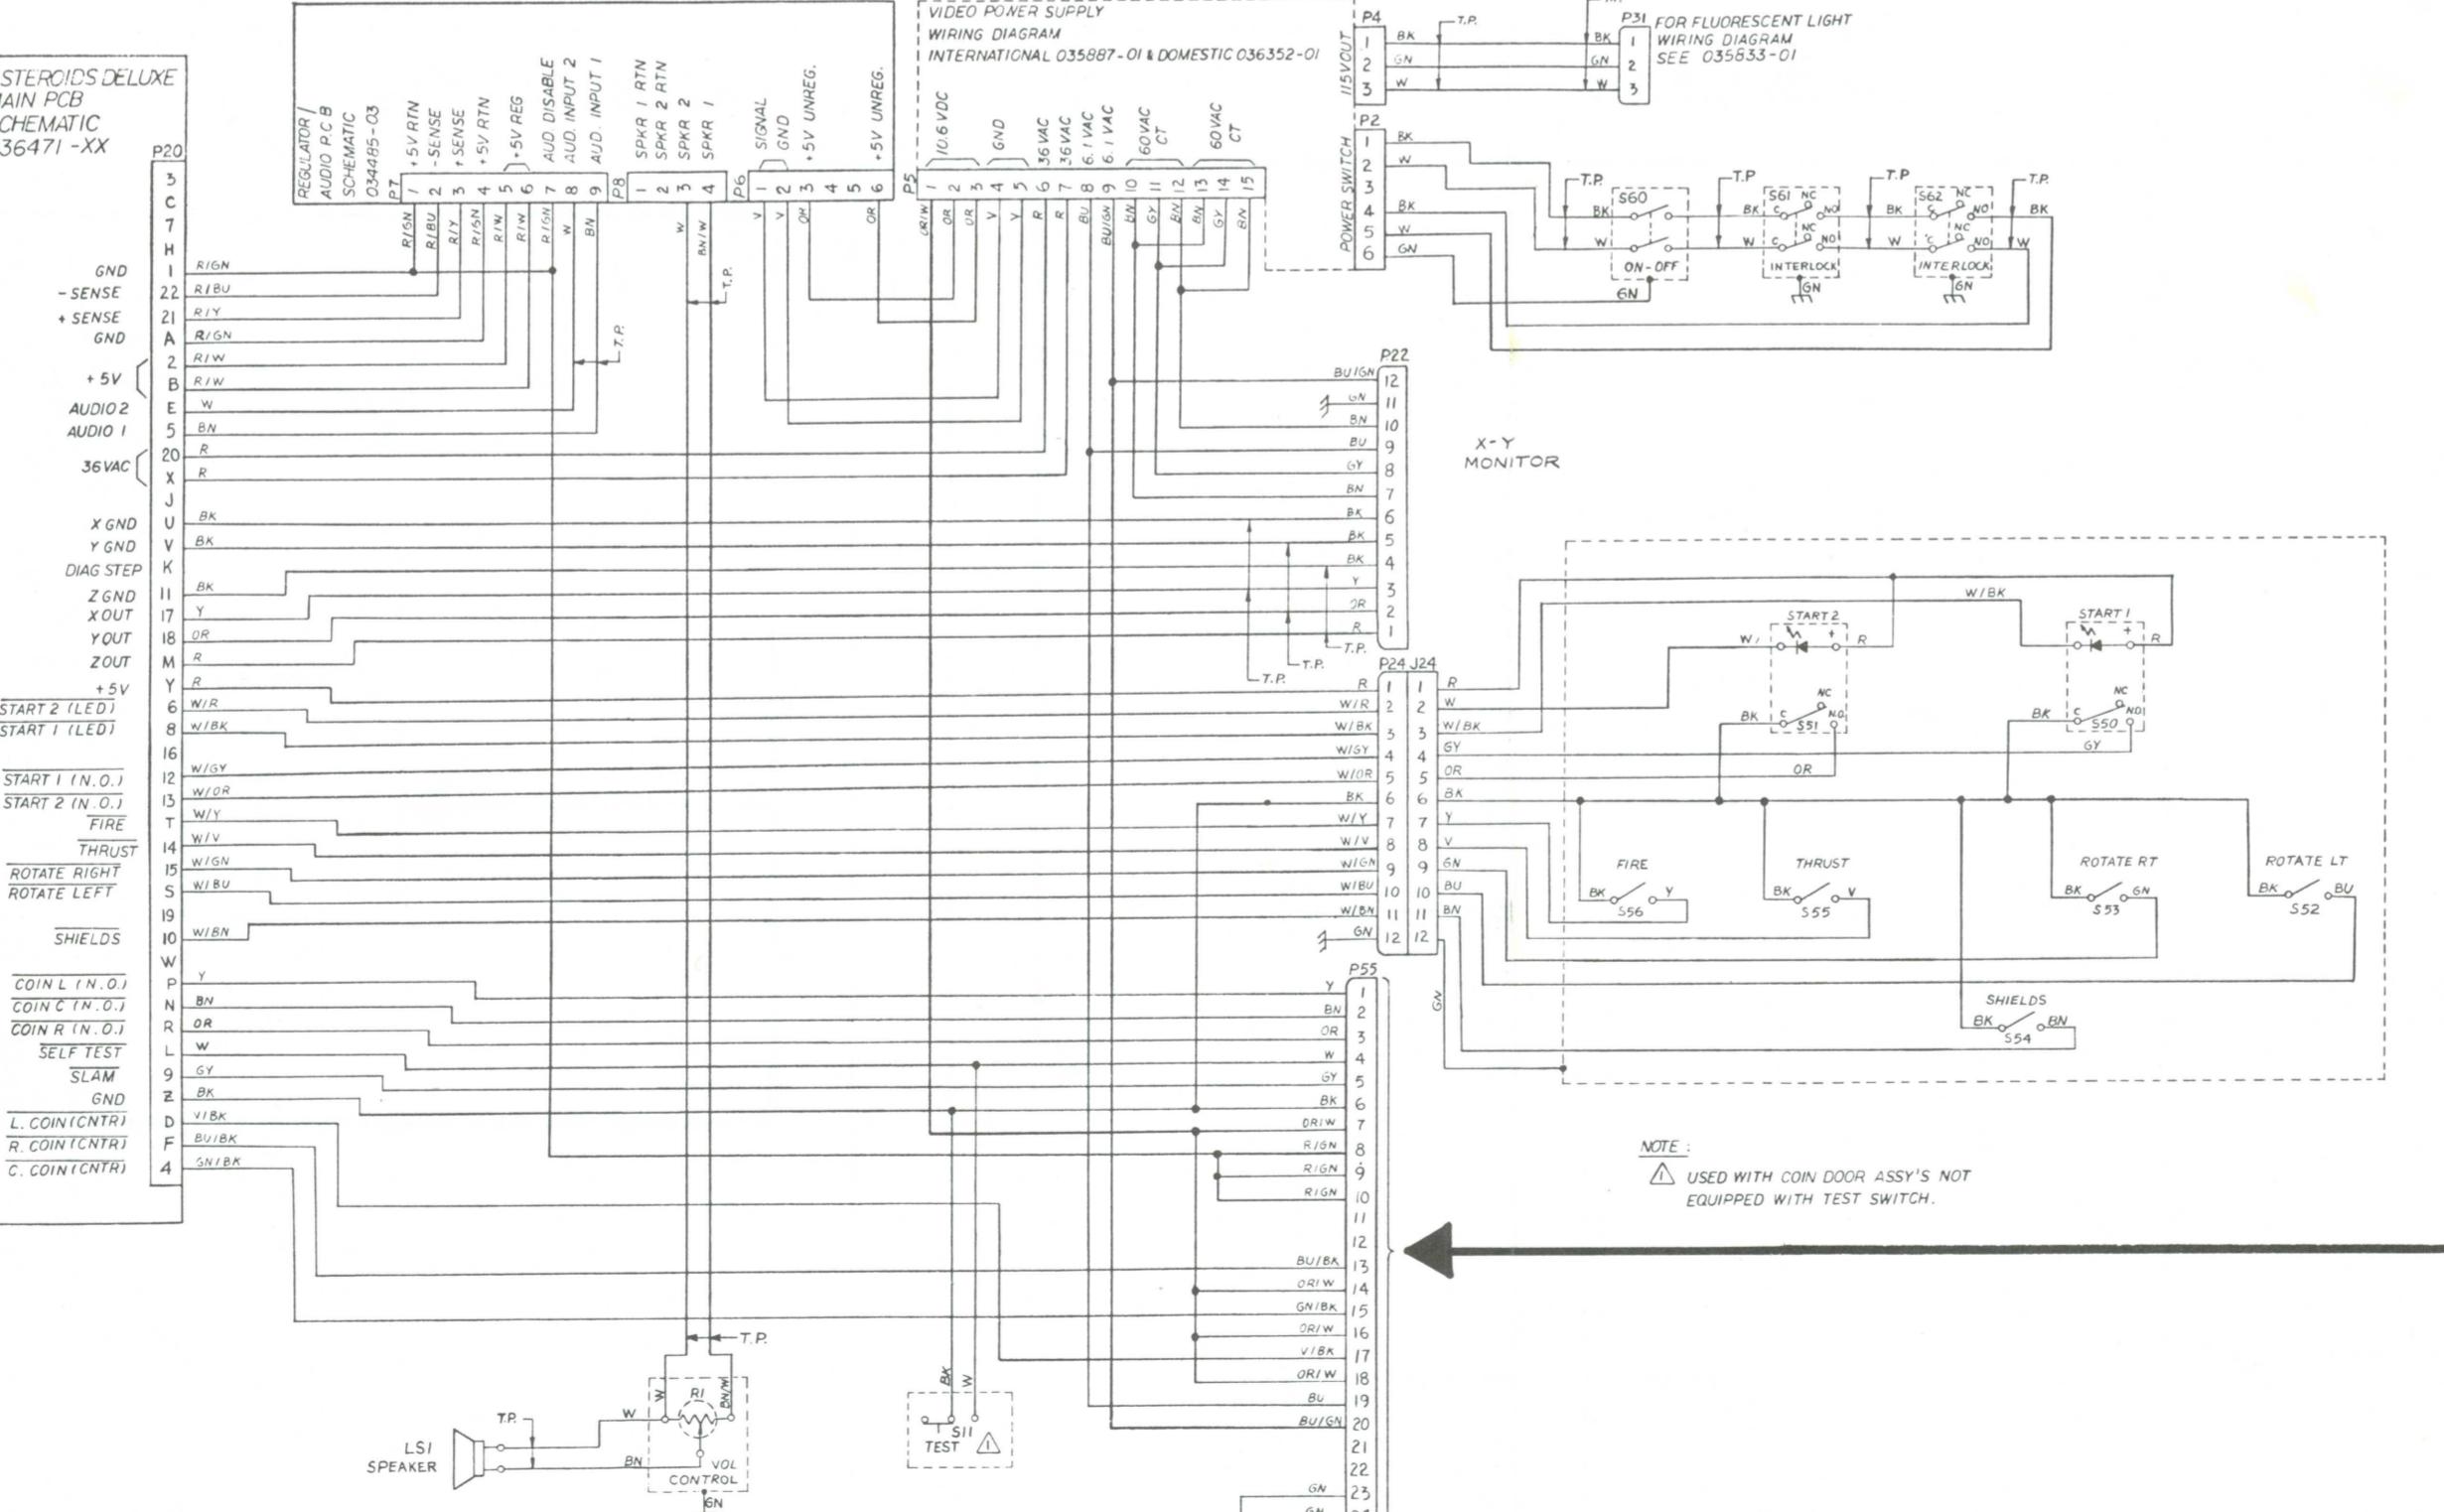

Audio Circuit

The audio circuit contains two independent audio amplifiers. Each amplifier consists of a TDA2002AV amplifier with a gain of ten.

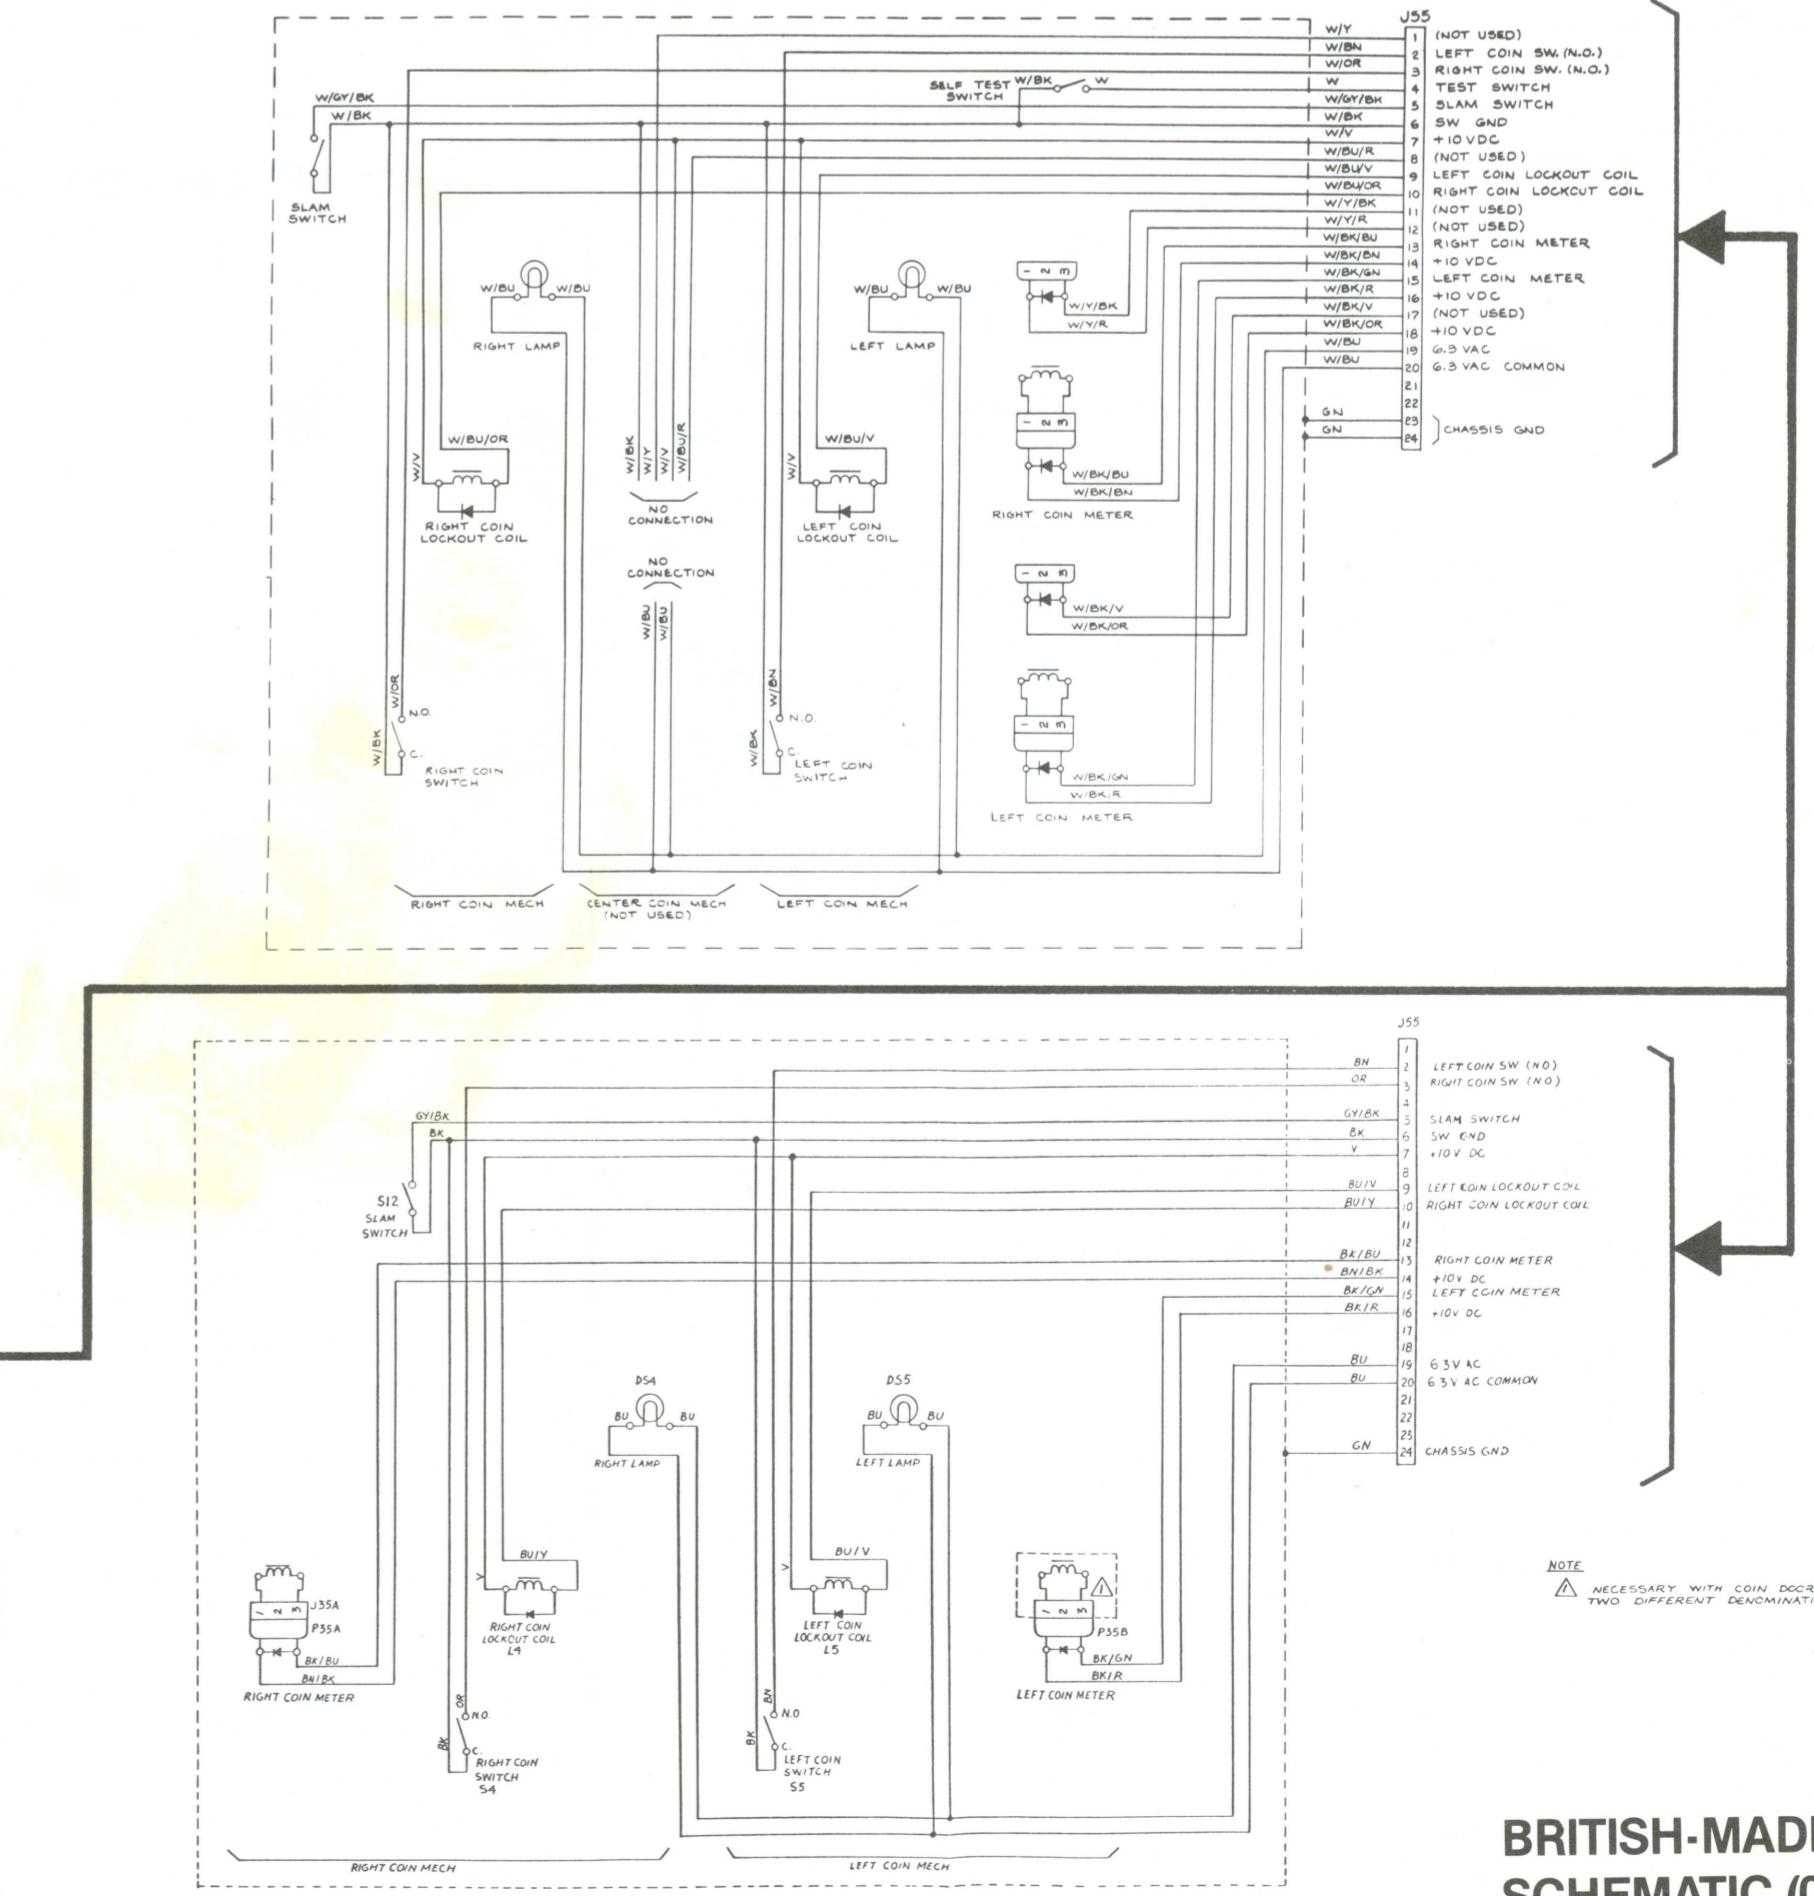

Denotes a test point
